

The Snapdragon is a tension-driven attachment mechanism designed to secure a motorized carriage to the cylindrical undercarriage beams of an X-folding wheelchair. This design utilizes a "claw-shaped" interface that anchors to the internal carriage board using flat-head screws, while the opposing tensioned component snaps onto the wheelchair beams. By employing rubber bands as the primary tensioning element, the Snapdragon adapts to varying wheelchair widths while maintaining a stable, low-profile connection for integrated electronics and propulsion components.
